

ENVY™

TURF AND ORNAMENTAL PIGMENT

Getting the most out of your spray inputs is critical, and being able to do it while providing your customers with turf and ornamentals that are pleasing to the eye is an added bonus. Envy™ allows you to do both.

Envy is a unique combination of pigments and adjuvants. Its stable formulation is designed to enhance aesthetics, improve spray coverage and act as a spray indicator when applied to turf, trees and shrubs.

ENHANCED AESTHETICS

Turf treated with Envy has a natural, green color. It can be applied to actively growing turf to improve its appearance or mask areas discolored by drought, insects, disease or traffic. Envy can also replace over-seeding on warm-season turf, saving seed, fertilizer, water and labor.

ADDITIONAL BENEFITS

Easy to use:

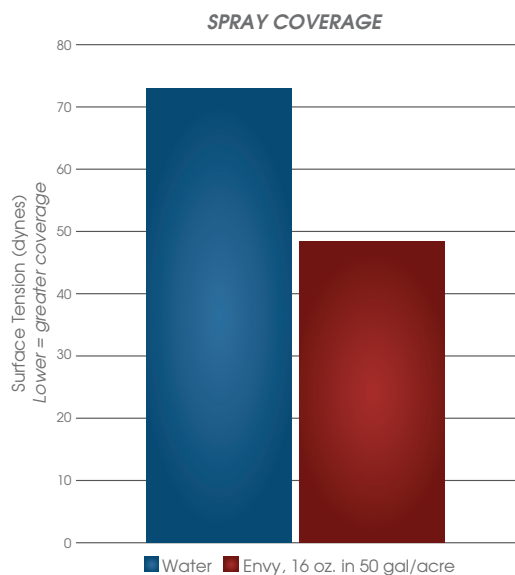

- Turf: 16 ounces in 50 gallons of spray solution per acre
- Ornamentals: 16 ounces in 50 gallons of spray solution applied to drip

Stable and compatible:

- Stores, mixes and loads at low temperatures
- Compatible with most foliar applied products

Lelacheur Park - home of the Lowell Spinners. Lowell, MA

IMPROVED COVERAGE & ADHESION

The performance of a pigment is affected by coverage on, and adhesion to, the plant's surface. Pigments applied alone, do not adequately spread or stick to turf, trees or shrubs. Envy contains adjuvants that disperse the pigment evenly across the waxy plant cuticle, resulting in a thinner spray coating that dries quicker and promotes better adhesion of the pigment and its tank mix partners, such as fungicides or plant nutrients.

SPRAY VISIBILITY

When applied at a low use rate, Envy is an effective spray pattern indicator, eliminating waste due to overlaps and skips, while indicating drift and improper application.
