

Description:

Sunrye Brand perennial ryegrass blend incorporates the latest technologies and advancements in perennial ryegrass breeding and research from Pure-Seed Testing, Inc. Pure Seed has produced these top performing varieties and blended them together to offer the ultimate choice of perennial ryegrass for turf professionals everywhere.

The varieties selected for the Sunrye blend have been chosen based on the widest range of performance characteristics for perennial ryegrass. These characteristics consist of disease resistance including: gray leaf spot, brown patch, red thread, and rust pressure. Sunrye also contains heat & drought tolerance, salt tolerance, and excellent wear and traffic performance. Sunrye displays a very dark green color and density at variable mowing heights ranging from .25"-2.5"

Applications:

Given the overall performance characteristics, Sunrye is a perfect choice for all-around cool season turf. It will perform well in home lawn, commercial landscape, sod farms, golf courses, and high usage athletic field applications. Sunrye has also been a longtime and popular choice for the overseeding of dormant bermudagrass.

Geographical Adaptation:

With enhanced genetics and performance, Sunrye has a wide area of adaptation. It will perform well in all northern cool season climates. With it's improved tolerance to temperature extremes and disease pressures Sunrye performs well throughout the transition zone. Quick establishment and dark green color make it an excellent choice for Fall/Winter overseeding of dormant bermudagrass in warm climates of the south.

Seeding rates for a new lawn range from 7-10 lbs./1,000 sq. ft. (340-488 kg/ha). Golf and sports turf applications: 450-650 lbs./acre (503-728 kg/ha). Germination can be expected in 5-7 days during normal weather conditions.
